

# key role of the infrastructure in the data warehousing

**Cédrine Madera IBM**  
**Information IT architect**

## Agenda

- Customer today challenges
- Dynamic Data warehousing
- Operational Business Intelligence
- Keys platform choice selection
- New Intelligence & Dynamic infrastructure in smart planet

New  
Intelligence

# Why is it a challenge for organizations to leverage information effectively?

Information distributed in silos across the organization

Volume and variety of information increasing

Velocity of business driving real-time requirements

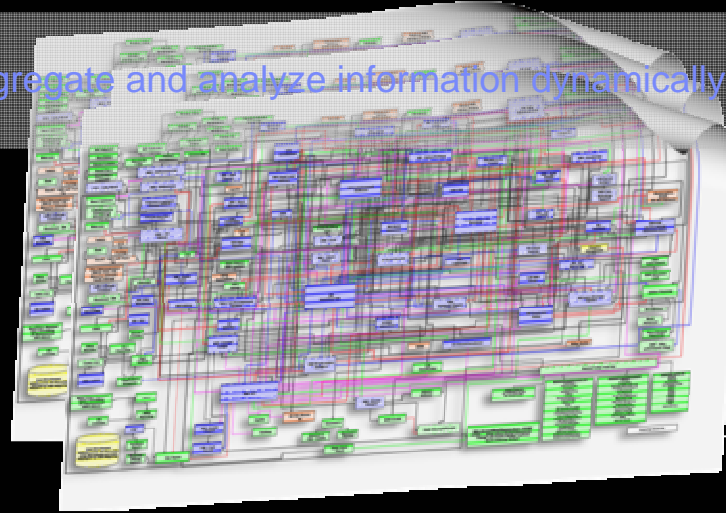

Not accurate

Not complete

Not trusted  
Not timely

Increased need to aggregate and analyze information dynamically

## Key Drivers and Business Issues

### ■ Too much information and not knowing what's important

- Not using demand signals to drive supply chain
- Not using customer analysis to tailor marketing and sales
- Not leveraging valuable unstructured information

### ■ Multiple versions of the truth

- Problems managing customer, product and partner interactions
- Regulatory compliance inhibited by poor transparency

### ■ Lack of trusted information

- Incomplete, out-of-date, inaccurate, misinterpreted data
- Difficult to understand or control how information is used

### ■ Lack of agility

- Inability to take advantage of opportunities for innovation
- Escalating costs due to inflexible systems and changing needs

# Dynamic Warehousing

## *A New Approach to Leveraging Information*

**Information On Demand**  
to Optimize Real-Time  
Processes

Action

*Dynamic  
Warehousing*

**OLAP**  
to Un  
Recom

*Dynamic Warehousing Requires:*

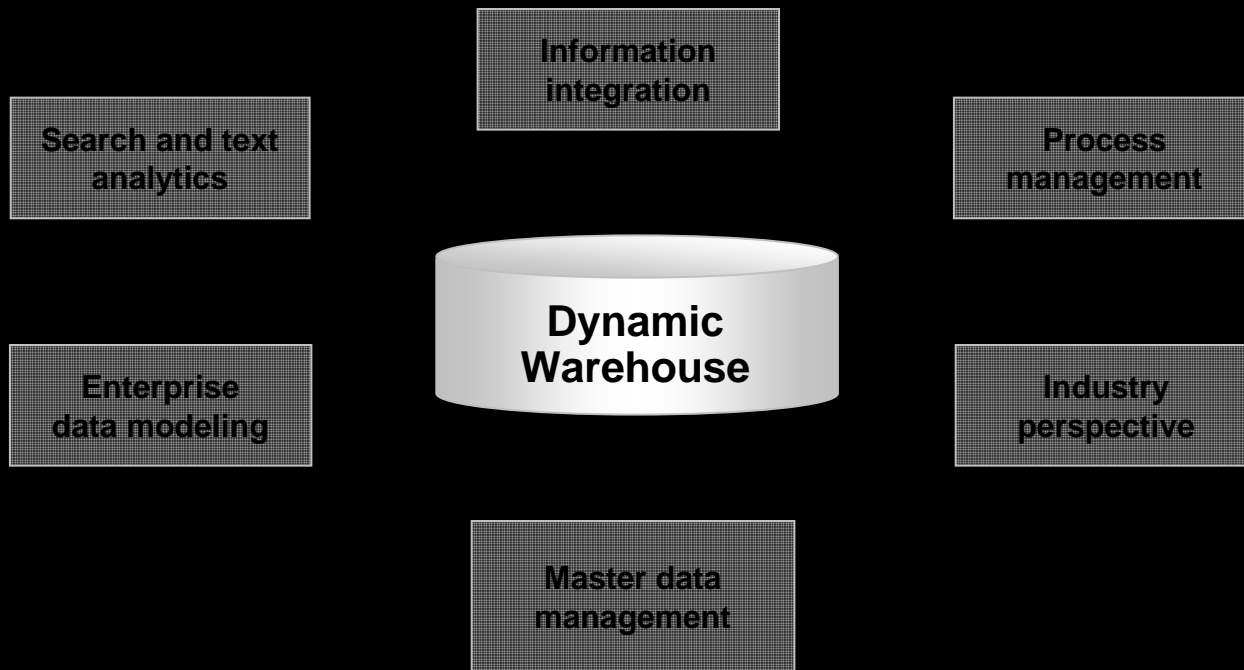

- 1. Real-time access – in context*
- 2. Analytics – as part of a business process*
- 3. Unstructured information – extracted knowledge*
- 4. Extended infrastructure – tightly integrated*

**Query &**  
to Un  
What happened

Reporting

# Dynamic warehousing

*Extending beyond the warehouse to enable information on demand*

# More Examples of Dynamic Warehousing in Action

## *Enabling Information On Demand for Business Advantage*

Traditional warehousing		Dynamic warehousing
Insurance fraud analysis and reporting	▶	Identifying potentially fraudulent claims prior to approval and payment <b><i>Transforms healthcare</i></b> 
Reporting on customer issues	▶	Identifying possible related issues, churn risk and cross-sell opportunities while engaged with the customer <b><i>Transforms customer service</i></b> 
Historical sales analysis and reporting	▶	Discovering relevant customer information to identify cross sell opportunities and improve negotiating position at the point of sale <b><i>Transforms sales effectiveness</i></b> 

## Creates challenges for traditional warehousing

*Not just for traditional query and reporting purposes anymore*

### Warehouses must now:

- Address expanding needs for **analytics** and information on demand
- Leverage ALL types of information, including **unstructured**
- Serve **increasing numbers and types of applications** and users, with varying service level demands

Increasingly **mixed workload environments**  
and the **constantly changing needs** of different business  
constituents  
require more **dynamic warehousing** capabilities

**How to Address the Challenge?**

**Take care about the platform selection!**

What are the keys points for the platform selection ?

## Platform key points

- Performance
- Scalability
  - Scale UP or OUT
- Reduced Costs through Server Consolidation
- Green
- TCO in database serving
- Work Load Management
- Reliability & availability
  - **BI is mission critical.**

# Operational Business Intelligence

**What it is?**

## Business Intelligence (BI): what it is?

BI is the process of gathering, consolidating, and analyzing data from multiple sources for strategic decision making.

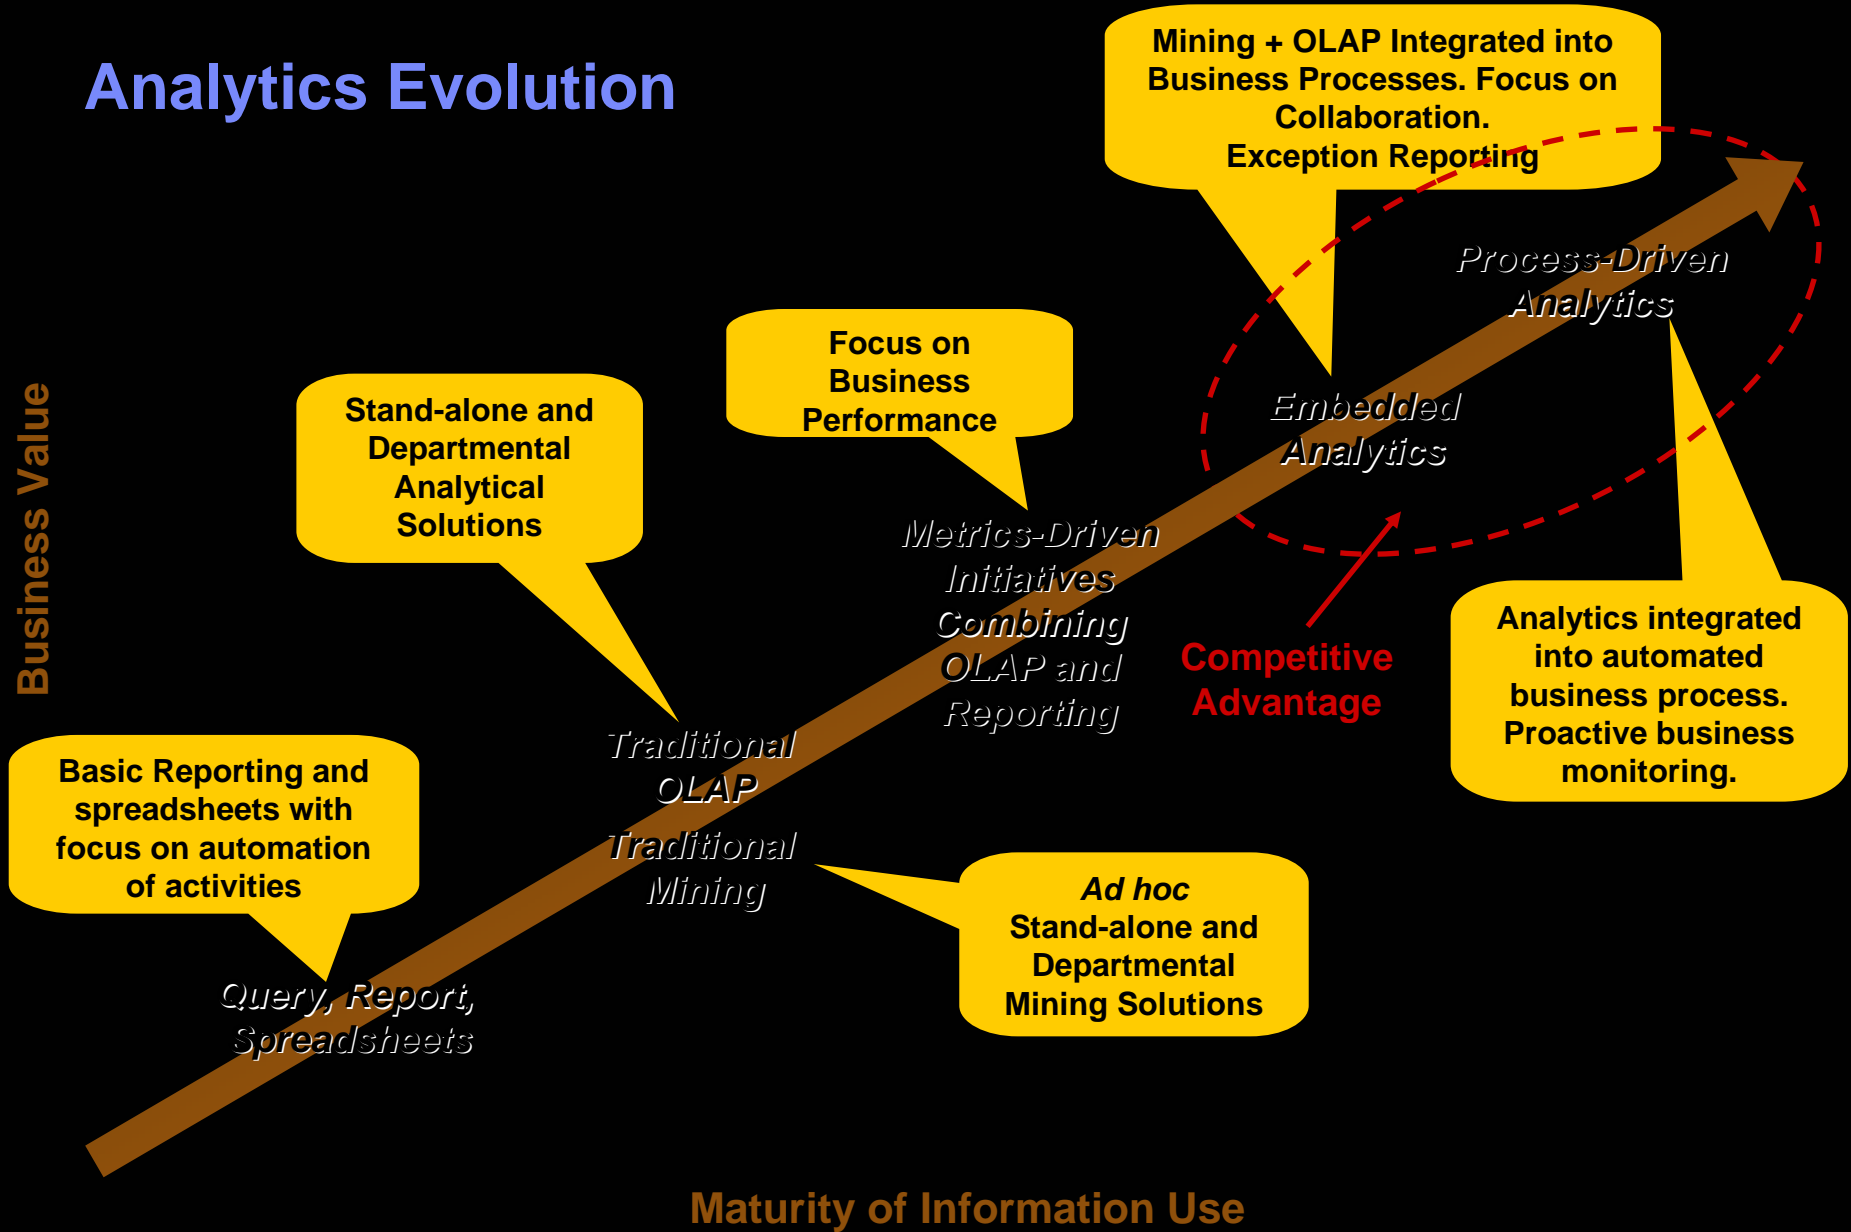

- BI derives **new value** from your transactional data
- BI supports **strategic planning**, monitoring, and efficiency
- BI delivers **knowledge** of the customer, suppliers, and channels
- BI unifies the enterprise with a **single version of the truth**
- BI develops the **insight and understanding** needed to make informed decisions

**Transform data to information**

# Analytics Evolution

Business Value

Maturity of Information Use

## Operational BI

- Operational BI
  - Framework where **key operational business events** are **monitored** for changes or trends
  - Enables **business** users to take **corrective actions**
- **Event-driven**
  - As operational events happen, they are registered and reported upon
- **Push technology**
  - Monitors key events for proactive interactions

Operational BI is a way to speed up business decisions

## Key Operational BI Requirements

- Continuous availability of operational data
  - Current information from operational systems
  - Integrated on demand
  - Minimal impact on operational systems performance
- Presented in a proactive manner
  - **Make decisions – act on information presented**
  - Easy to understand and use
- Combination of structured and contextual data
  - Data without context is meaningless
- **Dynamic** modeling
  - Ability to change business rules on the fly
  - Show different set of metrics depending on the situation

## The Three Levels of Business Intelligence

	Strategic BI	Tactical BI	Operational BI
Business focus	Achieve long-term business goals	Manage tactical Initiatives to achieve strategic goals	Manage and optimize daily business operations
Primary users	Executives and business analysts	Executives, analysts, and LOB managers	Analysts, LOB managers and users, and operational processes
Time-frame	Months to years	Days to weeks to months	Intra-day
Data	Historical data	Historical data	Real-time, low-latency and historical data

## Traditional vs. Operational BI

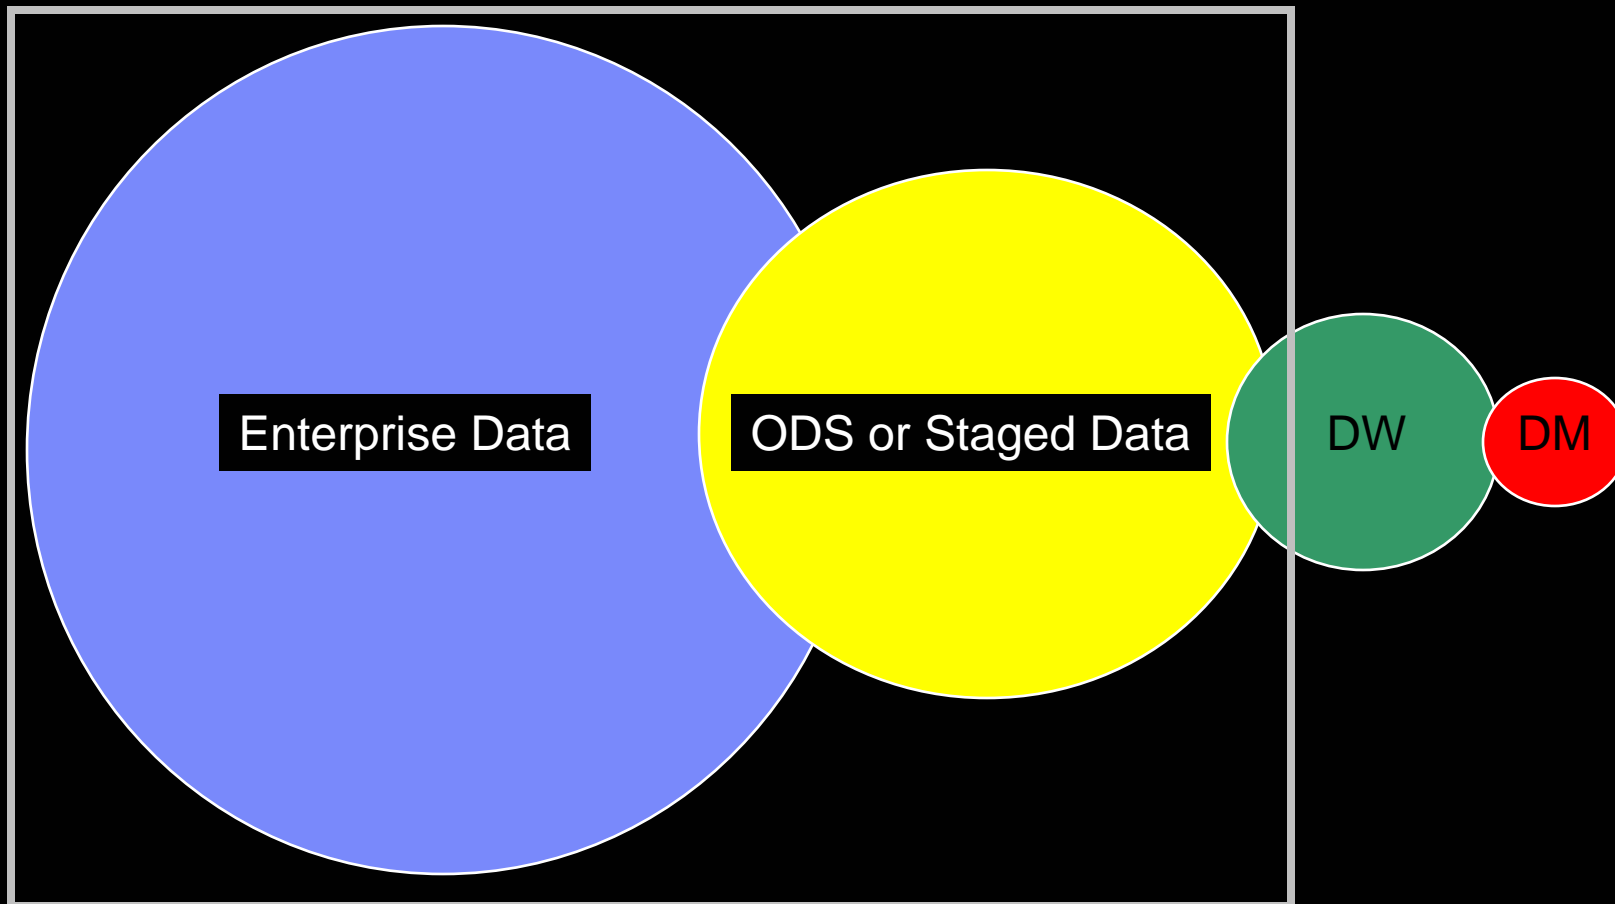

Traditional BI	Operational BI
Aggregated data fed by large volumes of captured information	Detailed information with smaller sets of data and delivered right-time
Targeted toward management and executives	Targeted toward operational staff who interact with customers
Significant investment in end user technical skills to create BI output and deliverables	Minimal skills required by the end users
Historical view within the analytics (e.g. what happened last year compared to this?)	What's happening now? Contextual information for optimizing customer interaction

**New  
Intelligence**

## Uses of Data and Volumes by End User Type

## Uses of Data and Volumes by End User Type

Operational BI is targeted toward the use of data at the granular level ... often at near real-time moments

## Issues around Business Intelligence ....

- Query performance
  - Large data volumes
  - Data quality
  - Varying service level demands
- 
- Companies locked into “Excel culture”
  - Information distributed across silos in the enterprise
  - Need for analytics and information on demand
  - Need to leverage ALL types of information
  - Increasing numbers and types of applications and users

## The new challenges

**Propose smart approach to solve these real problems**

Complex data integration

Increased data  
volume/variety

Timely data

A global approach must include innovative infrastructure  
New intelligence in Dynamic infrastructure  
in action!

## Summary : Platforms requirements

### ■ Qualities of Service

- Availability
- Security and Regulatory Compliance
- Scalability
- Backup and recovery

### ■ Positioned for the future

- Web-based applications
- XML support
- Service Oriented Architecture (SOA)

### ■ Supported by research Features

- Super fast
- Improved efficiency, resiliency and storage scalability
- Just in Time capacity deployment
- ...and more

### ■ Operational data and the ODS together means

- Reduced complexity
- Reduced cost
- Shared processes, tools, procedures
- Streamlined compliance and security

### ■ Specialty engines improve TCO

### ■ Better leverage hardware skills and investment

### ■ Global BI solution product coverage on one platform

# Dynamic infrastructure & New Intelligence

Build a smart planet....

# For us to make sense of this new world, we must consider four critical questions

“Data is exploding and it’s in silos”

**I Need Insight**

*How can we take advantage of the wealth of information available in real time from a multitude of sources to make more intelligent choices?*

**New Intelligence**

“New business & process demands ”

**I Need to Work Smart**

*How can we work smarter supported by flexible and dynamic processes modeled for the new way people buy, live & work?*

**Smart Work**

“My infrastructure is inflexible and costly”

**I need to respond quickly**

*How do we create an infrastructure that drives down cost, is intelligent and secure, and is just as dynamic as today’s business climate ?*

**Dynamic Infrastructure**

“Our resources are limited”

**I Need Efficiency**

*How do we drive greater efficiencies, compete more effectively, and respond more quickly by taking action now on energy, the environment, and sustainability?*

**Green & Beyond**

Enterprise data is projected to explode at 57 percent CAGR through 2010.

Managers spend 2 hours a day searching for information – 50 percent of what they find is useless and 42 percent of them accidentally use the wrong data weekly.

*How can we take advantage of the wealth of information available in real time from a multitude of sources to make more intelligent choices?*

**New  
Intelligence**

# Businesses are under pressure to consume and analyze the data explosion with “New Intelligence”

## Volume of Digital Data

By 2010, the codified information base of the world is expected to double every 11 hours. Data is exploding, and its nature is changing to machine-generated – from sensors, RFID, meters, GPS systems and more.

## Variety of Information

With the expansion of information comes large variances in the complexion of the available data – very noisy with lots of errors and no time to cleanse in a world of real-time decision making.

## Velocity of Decision Making

The market demands that businesses optimize decisions, take action based on good information and use advanced predictive capabilities – all with speed and efficiency.

## Shift in WHAT We Analyze

Enterprises need a broader, systems-based approach to what they examine and optimize. Stream computing and event processing capabilities are enabling the analysis of extreme volumes.

## What must be made smarter for us to create new intelligence?

Do we treat information as a strategic asset with the same level of focus as cash or human resources?

Do we know what kind of insight is critical to our future growth?

Do we have our people, processes and information technology aligned to fully exploit information and gain new levels of intelligence across the organization?

Do we have a clear and decisive plan to instrument, connect and invest in the things we must to gather that insight?

Do we have results-driven business processes that allow us to turn insight into action?

What must we change about our leadership, organization, and governance approach to drive the maximum result from this new kind of intelligence?

# IBM helps to make the planet smarter

IBM helps clients work smarter supported by flexible and dynamic processes modeled for the new way people buy, live & work.

## Smart Work

IBM helps clients bring together deep customer insights with advanced technology and research to create new business models.

## New Intelligence

## Green & Beyond

IBM helps clients reduce energy costs, meet legal requirements, develop new business processes that fit their operations, and helps them offer a new portfolio of green services and products.

## Dynamic Infrastructure

IBM helps clients create an intelligent infrastructure that drives down cost, is secure, and is just as dynamic as today's business climate

# Questions?!?
